Data Centers

In today's fast paced business environment, data centers are the engines that keep most companies, institutions and governments running.

Whether impacted by a fire, storm damage or water exposure, recovering from a property loss to a data center can be challenging for all involved parties. The first instinct for most information technology (IT) professionals it to replace the affected items, which theoretically would enable the business to resume operation. While replacement is an option, restoration should be considered.

AREPA has experience with a wide variety of IT equipment such as:

▶ **Servers**
▶ **Network Equipment**
▶ **Storage Cabinets**
▶ **Power Distribution**
▶ **UPS Equipment**
▶ **Supporting HVAC, Fire Suppression and Security Systems**

AREPA has successfully restored thousands of pieces of data center equipment, enabling hundreds of businesses to restore their operations quickly, cost effectively and with minimal system integration.
